

SmartSend™

SmartSend is a utility that provides for dataset transfer directly from MVS (zOS) to MS Exchange or Lotus Notes.

Smart Dataset Transfer of E-Mail

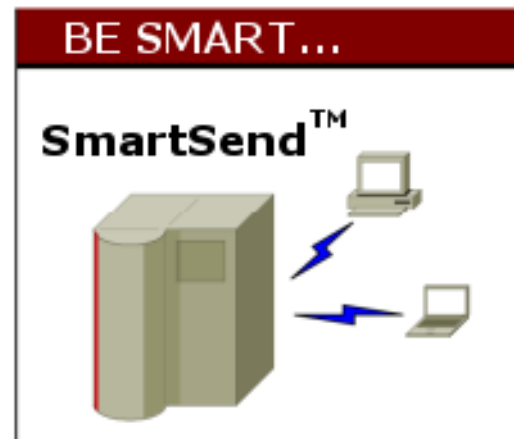

SmartSend transmits fixed-record text datasets using an organization's file transfer product, either IBM's FTP or MQ Series, directly from MVS to Notes or Exchange e-mail servers specifying either legacy mail system addresses or current Notes or Exchange addresses as the recipient(s) of the mailing.

How it Works

The SmartSend utility is comprised of two components: a mainframe utility which transmits a dataset and a Pc Server component that receives formats and mails the document. SmartSend then utilizes SMTP to send these documents to destination mail servers such as Lotus Notes and Exchange 2007 or 2010. Once they are processed they are deleted from the PC server.

Prior to using SmartSend, the Shuttle Manager Cross Reference file may optionally be built on MVS in order to correlate legacy addresses with current Notes or Exchange addresses. SmartSend is capable of resolving User Ids, Public Mailing Lists, and Bulletin Boards & Conferences (TAO only) with the use of this Cross Reference file. For the Lotus Notes version of SmartSend, an installed and operational Lotus SMTP MTA is required in order to send mail to Internet e-mail addresses, and the Exchange Internet Mail Connector is required for those users sending to the Internet through Exchange.

For Emc2/TAO customers - this replaces the MAILAWAY application, and does not require an Emc2/TAO system.

Unique Migration Projects

Our goal is to meet the needs of our customers. We can customize SmartSend and the E-Mail Shuttle to meet your unique project goals so please contact us to see how we can provide a solution for your complex migration. Contact Inware Technologies, Inc. at: 239-384-9335.
